

EVault Plug-in for Microsoft Exchange

Key Benefits

- Back up Exchange servers for disaster recovery
- Restore messages, folders and mailboxes
- Easy deployment
- Microsoft-approved integration
- Regulatory compliance
- Simple management
- Integration with Microsoft Volume Shadow Copy Service (VSS)

Supported Platforms

- Microsoft Exchange Server 2010
- Microsoft Exchange Server 2007
- Microsoft Exchange 2003
- Microsoft Exchange 2000

Back up and recover Microsoft Exchange servers and messages.

If your company uses Microsoft[®] Exchange for email, you need an easy, reliable, and secure way to back up your servers, and to restore any portion of your data, right down to individual messages.

EVault[®] Plug-ins for Microsoft Exchange provide the industry's most flexible, efficient, and cost-effective solution for protecting Microsoft Exchange data. Depending on your needs, you can employ EVault Plug-in for Exchange (DR) or EVault Plug-in for Exchange (MAPI and DR). Both work seamlessly with EVault Software and EVault SaaS.

Get Ensured Disaster Recovery

The EVault Plug-in for Exchange (DR) gives you a Microsoft-approved method for protecting and restoring entire Exchange servers. You can run full database backups on a daily basis without the extended window associated with traditional full backups. Should disaster strike, your data is ready to be restored in a single pass. EVault block-level delta processing technology minimizes the size of your backups, so restores are fast.

Protect Mailboxes and Messages

If you require more granular protection, add the EVault Plug-in for Exchange (MAPI and DR). It lets you back up and restore individual messages, folders, or mailboxes. With this capability you don't have to restore an entire Exchange database just to retrieve a mailbox or individual file. Options let you filter attachments, calendar items, tasks, and more to reduce the amount of data captured in a backup.

Comply with Regulations and Governance

EVault Software's backup options are flexible and easy to configure, making it simple to create retention schedules that satisfy privacy and security regulations, as well as your company's specific governance policies.

Simple Backups and Flexible Restores

You can centrally manage your backups and restores from the same straightforward web-based console. Wizards ease the learning curve, helping you set backup dates, times, and retentions. Thereafter, EVault Plug-ins scan Exchange servers for changed blocks of data, compress and encrypt them, and then transfer them to the EVault Director running on the backup vault.

To restore your data, simply select the file or directory to be restored, the date and time of the backup, and the destination for the restore. EVault Director assembles the file image to be restored and sends the recovered data image to the designated server.

Features and Benefits

Feature	Function	Benefit
Customizable backup tasks	Back up individual message types and attachments with a few mouse clicks.	No longer limited to an “all or nothing” backup option. Create email retention policies based on business need.
Hot backups	Conduct backups while Exchange Server remains operational and available to users.	Supports 24x7 operations
Flexible, granular recovery capability	Direct data restoration back to the same Exchange Server or to a Recovery Storage Group on the same or alternate Exchange Server. Restore an older Exchange Server to an upgraded one. Recover the entire server or down to an individual email.	Efficiently recover what you need and return to operations
Pre-scan searches	Search for multiple copies of a single message or attachment.	Avoid protecting unnecessary versions. Save on storage costs
Wizard-based GUI	Walks users through backups and restores.	Install and configure in just minutes
Support for Local Cluster Replication (LCR), Continuous Cluster Replication (CCR), and Standby Continuous Replication (SCR) in Exchange 2007 environments	Provide enhanced protection for high-availability messaging systems.	Data remains protected—even in the event of mail store corruption or disk corruption

EVault Agent

Scans the server for changed data and delivers those changes to the electronic vault.

EVault Delta Processing

The EVault platform’s own delta processing algorithm that recognizes changed blocks of data and new files created since the previous scan.

EVault CentralControl

Use a web browser to remotely manage and configure all servers with the EVault Agents installed across a LAN or WAN environment.

EVault Director

Powers the electronic vault, stores and catalogs the backups, and monitors the backup process.
